Experience

GrammaTech

Ithaca, NY

Director of Automated Software Engineering

2018 – present

- Propose and lead government funded research and development projects.
- Manage technical staff including software engineers and senior scientists.
- Lead GrammaTech's *Binary Rewriting* and *Program Synthesis* research areas:
 - Program Synthesis*: Programmatic analysis and transformation of software source-code to automate common software engineering tasks including refactoring, maintenance, optimization, bug repair, and bug injection
 - Binary Rewriting*: Programmatic analysis and transformation of stripped COTS binaries, without access to source-code, to improve their security and efficiency
- Maintain and grow technical infrastructure, support commercial transition.
 - Helped spur and manage a company-wide transition from SVN to Git and adoption of continuous integration (CI) practices.
 - Managing refactoring of a 2-decade-old C/C++ code base to modular, testable, modern C++, built with CMake. Already resulting in dramatically increased developer productivity. Done *in-flight* will completing contract deliverables.
 - Manage open-source projects including;
 - *Software Evolution Library*: <https://github.com/grammatech/sel>
 - *GrammaTech Intermediate Representation for Binaries*: <https://github.com/grammatech/gtirb>
 - *Datalog Disassembler*: <https://github.com/grammatech/ddisasm>
- Lead or oversee the following research and development efforts:
 - Binary rewriting for debloating*: Primary proposal author and principle investigator of GrammaTech's largest research project. Develop novel methods of binary analysis and transformation to reduce size, runtime, and attack surface of legacy binaries for the US Navy. Developing novel decompilation and disassembly technologies advancing the state of the art in reverse engineering and binary analysis. Engineering new internal representations to enable cooperative binary analysis and transformation. Developing novel aggressive optimization techniques including new methods of super-optimization and a massive peephole optimization database.
 - Bug-Injection for Cyber-defense tool evaluation*: Developed a tool to inject bugs into the source code of C/C++ and JavaScript software. This tool has been used by NIST to produce published benchmarks for static analysis tools, and has led to commercial sales to customers in the intelligence community.
 - Auto-merge*: Developing practical tools for the improved difference and merging of branches of software repositories.
 - Building resource adaptive systems*: Oversee a project to automate common software maintenance tasks such as adapting to changing environments including automatically changing software resource consumption profiles and automatically rewriting to use new libraries and APIs. The C/C++ front end developed to support this work is now integrated into the C Language family frontend for LLVM (CLang).

Senior Scientist

2014 – 2018

- Contributed to the following research and development efforts:
 - Structured Diversity*: Helped lead an effort to rewrite COTS binaries into N-variant systems. Leveraged SMT solvers to generate provably-secure multi-variant memory configurations.
 - Evolving exact decompilation*: Proposed and led research into the use of evolutionary techniques and recurrent neural networks (RNNs) to evolve *exact* C decompilation of stripped COTS binaries. Decompilation terminates when C source is found which recompiles to a new binary that is byte-for-byte identical to the target binary.
 - Binary program repair*: Proposed and developed techniques for automated repair of ARM IoT (internet of things) firmware. Evolved regular expression guards to refine partial repairs into general fixes.

University of New Mexico

Research Assistant

Albuquerque, NM

2009 – 2014

- Research and development of evolutionary techniques for software maintenance and improvement.
 - Developed novel techniques of software repair applicable to compiled assembler code and stripped binaries.
 - Developed an evolutionary search-based optimization technique applicable to compiled assembly code. Reduced energy consumption of a range of benchmark programs by 20% beyond the best available compiler optimizations.
- Empirical and theoretical investigation of biological properties of software.
 - Empirically explored the robustness of software to random perturbation. Demonstrated mutational robustness across; C/C++ source, compiled assembler, LLVM intermediate representation, and stripped executables.
 - Identified empirical evidence that the modern software development ecosystem is the product of an evolutionary process in which software developers and users perform mutation, reproduction, and fitness evaluation.

Counsyl

Open Source Software Consultant

Palo Alto, CA

2010 – 2011

- Consultation and development in application of open-source software to automated technical document generation.

The MITRE Corporation

Senior Artificial Intelligence Engineer

McLean, VA

2005 – 2009

- Lead developer of the Rapid Argus Modeling for Biosurveillance Operations (RAMBO) system for disease modeling and surveillance. RAMBO ran Bayesian models over text media statistics collected from across the world to identify emerging epidemics. RAMBO was used daily by roughly 50 biosecurity analysis at Georgetown University.
- Prototype the STAT (Statistical Tracking and Analysis of Text) system for temporal analysis of multilingual text.
- Systems administration for production Unix/Linux systems.

International Technical Analyst

2004 – 2005

- Research assistant, composed documentation and user manuals.

Volunteer

Planned Parenthood

Clinic Escort

Pittsburgh, PA

2019 – present

National Poor People's Campaign

Web Design

2020 – 2020

- Designed, built, and maintained the *Nonviolent Medicaid Army* web site at <http://nonviolentmedicaidarmy.org>.

GNU Emacs

Contributor

2009 – 2014

- Author and maintainer of Emacs Org-mode's facilities for embedding executable source code into documents.

Education

University of New Mexico

Ph.D., Computer Science

Advisor Stephanie Forrest

Thesis Neutral Networks of Real-World Programs and their Application to Automated Software Evolution

Albuquerque, NM

2014

Kenyon College

B.A., Mathematics, Minor Philosophy

Gambier, OH

2004

Skills

Programming languages: Common Lisp, C/C++, JavaScript, Python, OCaml, Clojure, Scheme, Prolog/Datalog

Technical Expertise: Emacs, Git, Docker, CI, Linux, GDB, SMT/SAT (Z3, CVC4), Markdown, L^AT_EX, HTML/CSS

Domains: Artificial Intelligence, Programming Languages, Software Engineering, Binary Analysis, Formal Methods

Publications

Doctoral Thesis

Eric Schulte. *Neutral Networks of Real-World Programs and their Application to Automated Software Evolution*. PhD thesis, University of New Mexico, Albuquerque, USA, July 2014. <https://cs.unm.edu/~eschulte/dissertation>.
